

### Environment and Society Centre

- How are international resource dynamics around energy or food currently being reflected or translated in emergency or humanitarian settings?
- How can international finance and/or policy mechanisms be reimagined and or reinvigorated to better address climate, energy, natural resource, and environmental issues in humanitarian settings?
- How are migration issues integrated in nationally determined contributions? And what might be some of the future models to better integrate displaced people into national climate targets?
- How do local political economies and black markets and war economies play a role in resource conflicts in and around humanitarian settings?
- To what extent are refugees and displaced people included in sustainable energy policy and progress towards SDG 7 on sustainable energy and SDG 13 on climate action? Are displaced people meaningfully included in policy debates and energy programme design? What does transformative, inclusive change look like for the humanitarian sector?
